TONGA NATIONAL FORM SEVEN CERTIFICATE 2022

BIOLOGY

QUESTION AND ANSWER BOOKLET

Time allowed: 3 Hours

INSTRUCTIONS:

- 1. Write your **Student Enrolment Number (SEN)** on the top right-hand corner of this page.
- 2. This paper consists of **FOUR SECTIONS** and is out of 82 weighted scores.

SECTION	STRANDS	TOTAL SKILL LEVEL
ONE	Animal Behaviour	23
TWO	Gene Expression	18
THREE	Biotechnology Applications	18
FOUR	Processes and Patterns of Evolution	23
	TOTAL	82

- 3. Answer ALL QUESTIONS. Write your answers in the spaces provided in this booklet.
- 4. Use a **BLUE** or **BLACK** ball point pen only for writing. Use a pencil for drawing if required.
- 5. If you need more space for answers, ask the supervisor for extra paper. Write your **Student Enrolment Number (SEN)** on each additional sheet, number the questions clearly and insert them in the appropriate places in this booklet.
- 6. Check that this booklet contain pages 2-23 in the correct order and that none of the pages is blank.

SECTION ONE: Animal Behaviour

Question One: Orientation and Navigation

a.

The diagram below shows two different behavioural responses by two organism to a stimulus.

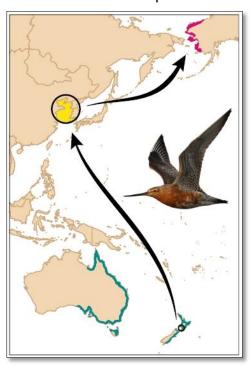

Figure 1: The behavioural responses of two organisms to light.

Source: https://www.youtube.com/watch?v=AAJNaoYKMbA

Differentiate between the behavioural responses (kinesis and taxis) shown in Figure 1	l.

The Bar-tailed godwit, *Limosa lapponica* undertakes one of the world's most amazing migratory journeys. Recent research shows that some individuals from the East Asia/Australasia Flyway population made a nonstop flight of over 11,000 km, the longest continuous journey that has ever been recorded for a land bird.

Figure 2: The migration of the Bar-tailed godwit from New Zealand and Australia to Alaska in the United States with a stop-over in China.

Question Two: Timing Responses

a.

actogram.

The diagram below illustrates an actogram of a Tongan flying fox, *Pteropus tonganus*. The activity of the flying fox is under endogenous control.

Some of the distinguishing features of *Pteropus tonganus* are: big eyes, large wing and rough tongue. *Pteropus tonganus* has a fast digestive system and excretes faeces roughly 20 minutes from the time food is ingested.

Question Three: Interspecific Interactions

Define niche differentiation.

a.

The diagram below shows an observation made by Roseta, an ecologist from the National University of Tonga. She reported that three different birds inhabited different parts of an unnamed tree in the Manamo'ui forest community.

This is a significant discovery because 20 years ago she observed that **all** the birds coexist with each other in all parts of the tree.

Question Four: Intraspecific interactions

Social primates like spider monkeys can live in groups of up to 30 individuals.

When foraging during the day, these large groups may split into smaller sub-groups (between 2 and 8 animals) and they reunite again during night time.

Each group has a territory that the males use to mark with their scent glands. Anyone stumbling into spider monkey territory receives an unpleasant 'welcome' of screams, barks and rattling branches and thrown branches or faeces. Young adult males in the group protect the young ones and females from rival groups.

Figure 5: A spider monkey with an infant and is dependent on the mother's milk.

Source: https://www.discovery.com/nature/spider-monkey

Spider monkeys are polygamous yet displayed both cooperative and competitive a. behaviours.

Describe EITHER ONE (1) of cooperative and competitive behaviour using spider

SECTION THREE:

BIOTECHNOLOGY APPLICATIONS

Question One: Transgenesis

DNA can be sliced from different sources and fused to form **recombinant DNA**. The recombinant DNA is then introduced into the genome of another organism. This is often carried out in a process known as **transgenesis**.

Figure 9 shows how insulin can be produced by transgenesis.

Source: https://ib.bioninja.com.au/_Media/insulin-production_med.jpeg

Question Three: DNA Profiling

The Police Department reported that a victim was stabbed in her home by an unknown suspect. DNA collected from the scene were used to generate the DNA profile shown in **Figure 11** below. Three known criminals who were present in the area were also asked to provide their own DNA voluntarily.

Their DNA profiles are also shown as suspect 1, 2 and 3 respectively.

Figure 11: DNA profiles from the crime scene and 3 suspects.

SECTION FOUR: PROCESSES AND PATTERNS OF EVOLUTION

Question One: Variation

The continuation of the human life-cycle requires both parents to produce gametes in Process \mathbf{Y} . When the parents mate, it will lead to Process \mathbf{W} .

The baby will be uniquely different from the parent and the rest of his siblings.

Figure 12: The processes that cause variation in the human life-cycle.

Question Three: Hardy-Weinberg Principle

In corn, kernel color is controlled by a dominant allele for white color (W) and by a recessive yellow allele (w). A random sample of 200 kernels from a population that is in Hardy-Weinberg equilibrium reveals that 18 kernels are yellow (ww) and 182 kernels are white.

Figure 14: Allele frequency in corn
